

- This new diagram has dedicated test cases for:

- 1) Traveling from floor 1 to floor 3 ($\uparrow$)
- 2) Traveling from floor 3 to floor 1 ($\downarrow$)
- 3) Floor 2 pick up when traveling from floor 1 to floor 3
- 4) Floor 2 pick up when traveling from floor 3 to floor 1

- At first, the test included door open + door closes for each case since the I attempted to use the door open cases at each floor as traveling case + door open case. It worked at first when I simulated simple scenarios without pick up in between.

- However, when I simulated the floor 2 pick up (case 7, 8, 9), and the next user picked floor 1 as the destination, the elevator go straight to floor 1 without completing the 1st destination (floor 3)

- Therefore, when there are pickup possibilities ($F1 \rightarrow F3$, $F3 \rightarrow F1$) I add dedicate stages and these stages will check if F2 needs pick up
